From Dialogue Circles to Algorithmic Repair: A Taxonomy of De-escalation in Interlocking Crises

The Vicious Cycle: Interlocking Dynamics of Domestic Polarization and International Conflict

The contemporary global landscape is increasingly characterized by societies confronting multiple, overlapping crises. A particularly potent form of this complexity arises when intense domestic political polarization coexists with international armed conflict or acute geopolitical tension [7]. This dual-pressure environment is not a theoretical construct but a documented reality, where the dynamics of internal division and external hostility create a self-reinforcing, mutually exacerbating cycle [76] [97]. Understanding this interlocking crisis is fundamental to developing effective de-escalation strategies, as interventions targeting only one dimension risk being ineffective or even counterproductive if they fail to account for the deep-seated feedback loops between domestic and international spheres.

Domestic polarization, defined as the increasing ideological distance and affective antipathy between societal groups, creates significant vulnerabilities that external conflicts can exploit and amplify [77] [96]. Internally fragmented states often struggle to formulate coherent foreign policies or mount unified responses to international provocations [7]. In Colombia, for instance, high levels of political polarization have been identified as a contributing factor to rural conflict and inequality, which are themselves precursors to broader armed conflict [9]. Similarly, severe political fragmentation can lead to governance vacuums that increase the risk of coups d'état, a clear symptom of political fragility [32]. This internal disarray prevents the formation of stable coalitions necessary to pursue diplomatic solutions, leaving societies more susceptible to polarizing narratives promoted by external actors [76]. The perception of Turkey in the Middle East illustrates how domestic policy problems can become deeply entangled with international relations, creating a feedback loop that hardens positions on both fronts [45].

Conversely, international armed conflict acts as a powerful catalyst for intensifying domestic polarization. Proxy dynamics, where major powers support opposing factions in a civil war, inject geopolitical interests into local disputes, blurring lines and hardening divides [11]. Even without direct proxy involvement, the spillover effects of war—such as refugee flows, economic instability, and security threats—can fuel nationalist sentiment and deepen societal cleavages [5] [88]. Violence from armed conflict generates larger and more widespread refugee movements, straining resources and increasing regional instability, which in turn can provoke domestic backlash against migrants and perceived security threats [5] [99]. This dynamic creates a vicious cycle: external conflict increases anxiety and insecurity, which fuels affective polarization—the growing mutual dislike between partisan groups—within a society [76] [82]. This heightened polarization, in turn, makes it nearly impossible to build the cross-partisan coalitions needed to support peace negotiations or compromise with an adversary, effectively locking the society into a path of escalating division [76] [95].

This interplay is further complicated by cross-cutting stressors like climate change. Conflicts make adaptation to climate change more difficult, while climate-driven risks, such as water scarcity or crop failure, can exacerbate existing tensions over natural resources, potentially leading to community-level violence [21] [24] [65]. Climate finance initiatives aimed at building resilience in fragile contexts must therefore navigate these intertwined crises, recognizing that environmental stress can be both a cause and a consequence of conflict [21]. The challenge for policymakers and peacebuilders is thus twofold: they must address the root causes of violent conflict before they materialize, while also managing the immediate symptoms of polarization and armed strife [8]. The most difficult challenge lies in responding effectively to the underlying drivers of conflict to prevent them from escalating into violence [8]. Any intervention must therefore be multi-pronged, acknowledging that efforts to cool domestic rhetoric may be undermined by ongoing military hostilities, and that diplomatic breakthroughs abroad will have little effect if they cannot penetrate the hardened ideological trenches at home. The goal, then, is not simply to manage two separate problems but to disrupt the destructive synergy between them.

Categorizing De-escalation: An Integrated Framework Based on Actor, Method, and Target

To navigate the complex landscape of actions aimed at de-escalating interlocking crises, a multi-dimensional classification framework is essential. No single axis of categorization—be it actor, method, or target—is sufficient on its own. Instead, a hybrid approach that integrates these three dimensions allows for flexible clustering and a more nuanced understanding of different interventions. This framework accommodates the full spectrum of agency, from individual actions to state-led policies, and encompasses both established practices and radical innovations.

The first dimension of classification is **by Actor Type**, which recognizes that the legitimacy, capabilities, and constraints of an entity fundamentally shape the nature of its interventions.

- **Individuals** engage in micro-level actions that can collectively produce macro-level change. These include participating in dialogue circles to bridge divides, practicing civil discourse online to counter affective polarization [75], or sharing alternative narratives to challenge polarized thinking [26]. Such actions are often grassroots and culturally embedded, drawing on local knowledge and relationships, such as community planners acting as neutral third actors to mediate local disputes [55].
- **Organizations**, particularly non-governmental organizations (NGOs) and Peace and Conflict Resolution Organizations (P/CROs), operate at various scales. They are instrumental in de-escalating violence through Track Two diplomacy, which involves unofficial back-channel communications between conflicting parties when formal talks are stalled [36] [38]. They build "peace infrastructures" by fostering networks of trust and cooperation across divides [12] and provide critical humanitarian aid and development assistance [50].
- **Political Parties and State Institutions** are central players in both domestic and international arenas. Domestically, they can enact legislation, such as workplace policies against domestic and gender-based violence [61], or reform education systems to promote inclusive citizenship [4]. Internationally, they wield diplomatic tools like brokering ceasefires, deploying ceasefire monitoring contingents [92], and engaging in UN Security Council resolutions that call for restraint and de-escalation [14] [40].
- **International Bodies**, such as the United Nations and the European Union, possess broad mandates and legitimacy derived from international law. The UN Security Council can authorize peacekeeping missions and pass binding resolutions to halt

hostilities [41]. Other agencies like the World Bank Group advise on stabilizing domestic and international payment systems in fragile states [6], while UNDP and UNICEF implement integrated development and peacebuilding programs [16] [50].
- **Corporations and the Private Sector** are becoming increasingly involved through "corporate activism," which can either escalate or mitigate conflict [35]. Their leverage stems from economic power, supply chains, and corporate social responsibility initiatives, such as China's promotion of green development on the global stage [89].

The second dimension is **by Method**, which groups actions based on their core mechanism of influence.

- **Direct Diplomatic and Political Action** involves formal negotiations, Track I diplomacy (official government-to-government talks), and international mediation facilitated by third parties or bodies like the UN [41] [47]. The goal is to achieve legally binding agreements, such as ceasefires or comprehensive peace treaties [19].
- **Conflict Mitigation and Confidence-Building Measures (CBMs)** are designed to reduce suspicion and prevent the escalation of tensions between adversaries. These can include tactical moves like a humanitarian pause during active combat, allowing for the delivery of aid and medical evacuations [14]. CBMs aim to build trust incrementally, facilitating a political process that can lead to more durable solutions [84].
- **Civic and Social Engagement** focuses on rebuilding fractured social fabrics and addressing the roots of affective polarization. This category includes educational reforms on competing visions of citizenship [4], cultural heritage projects that foster shared identity [30], and media literacy campaigns to combat disinformation and eroding epistemic trust [69].
- **Economic and Structural Levers** utilize financial and economic instruments as tools of influence. This ranges from punitive measures like economic sanctions imposed by states such as China [85] to incentivizing measures like targeted loans from the World Bank to post-conflict states [104]. More subtly, investments in climate adaptation or disaster risk management can serve as indirect peacebuilding tools by addressing shared vulnerabilities [21] [50].
- **Technological Mediation** applies digital tools to facilitate communication, negotiation, and data analysis in conflict zones. This spans from using digital platforms for citizen participation in policy-making [26] to employing sophisticated AI-enabled systems for predictive analytics or to assist mediators [47] [70]. The rise of

digital diplomacy is recasting traditional practices, shifting interactions both in form and space [46] [48].

The third dimension is **by Target Conflict Level**, clarifying whether an action primarily aims to impact domestic polarization, international armed conflict, or both.

- **Domestically Focused** actions seek to reduce division within a country's borders. Examples include promoting civility in public discourse [60], establishing commissions to investigate historical grievances, or addressing land ownership disputes that fuel social and political conflict [1].
- **Internationally Focused** actions are directed at de-escalating or resolving armed conflicts between states. This includes negotiating ceasefires, brokering peace treaties, and ensuring compliance with International Humanitarian Law (IHL), which sets rules to limit the effects of armed conflict [103][106].
- **Dual-Targeting** actions intentionally or unintentionally impact both levels simultaneously. For example, a successful Track II dialogue can inform official Track I negotiations (an international outcome) while also shaping public opinion and reducing polarized rhetoric at home (a domestic outcome) [38]. Similarly, a UN resolution calling for restraint has both an international legal function and a powerful signaling effect within domestic political debates [40].

By combining these three axes, a rich, multi-layered map of de-escalation actions emerges, enabling a more precise analysis of any given intervention.

Dimension	Category	Description
Actor	Individuals	Grassroots actions like dialogue circles, civil discourse, and personal reconciliation efforts. [12] [26]
	Organizations (Civil Society)	NGOs, P/CROs, and think tanks facilitating Track II diplomacy and building peace infrastructures. [12] [36]
	Political Parties & State Institutions	Enacting laws, deploying military assets, and conducting official diplomacy. [61] [92]
	International Bodies	UN, EU, World Bank providing legitimacy, funding, and institutional frameworks for interventions. [6] [40]
	Corporations & Private Sector	Leveraging economic power for corporate activism, sanctions evasion, or peace-related investments. [35] [89]
Method	Direct Diplomatic/Political	Formal negotiations, Track I diplomacy, ceasefire agreements, and UN-mediated settlements. [19] [47]
	Conflict Mitigation	Ceasefire monitoring, humanitarian pauses, and confidence-building measures to reduce suspicion. [14] [84]
	Civic & Social Engagement	Educational reforms, cultural projects, and media literacy campaigns to heal social divides. [4] [30]
	Economic & Structural Levers	Sanctions, loans, and investments in areas like climate adaptation to influence behavior. [21] [85]
	Technological Mediation	Digital platforms for citizen participation, AI for conflict prediction, and digital diplomacy. [26] [47]
Target	Domestic	Actions focused on reducing political polarization and social fragmentation within a nation. [4] [7]
	International	Actions aimed at halting or preventing armed conflict between states. [92] [103]
	Dual-Targeting	Actions that simultaneously impact both domestic and international conflict dynamics. [38] [40]

Defining Features: A Comparative Rubric for Evaluating De-escalation Interventions

Beyond categorization, a robust analytical framework requires a set of defining attributes to compare and evaluate the effectiveness, feasibility, and risks associated with different de-escalation actions. These features provide a rubric for assessing interventions across the spectrum from low-tech civic initiatives to high-stakes international diplomacy. The following attributes are critical for a comprehensive comparative analysis.

Scalability refers to the ease with which an action can be expanded from a small-scale pilot to a wider application. At one end of the spectrum, highly personalized actions like individual therapy or small-group dialogue circles have low scalability but can be powerful in specific contexts [12]. At the other end, broad policy changes, such as new election laws, or large-scale economic sanctions can be highly scalable, potentially impacting entire populations or economies [85]. However, high scalability does not equate to high effectiveness; it can also amplify negative outcomes. For example, algorithmic ranking on social media can scale up partisan animosity just as easily as it can connect people with diverse views [80]. Conversely, a localized, culturally adapted project like community-based natural resource management may have limited scalability but can be exceptionally resilient and effective within its specific context [65].

Speed of Impact measures how quickly an action produces tangible results. Rapid impacts are often associated with tactical or logistical interventions. For example, launching a ceasefire monitoring contingent or securing a humanitarian pause can bring an immediate reduction in violence [14] [92]. Similarly, a sudden shift in online discourse following a specific event can occur almost instantaneously [31]. In contrast, long-term structural changes, such as constitutional reform, rebuilding trust in democratic institutions, or shifting deep-seated cultural norms, unfold over years or even decades [54]. Peacebuilding is inherently a slow process, requiring sustained effort to identify and support structures that solidify peace in post-conflict societies [54]. The trade-off between rapid de-escalation and sustainable peace is a constant tension; rushing long-term processes can undermine the stability gained from short-term gains.

Institutional Reliance indicates the degree to which an action depends on formal, recognized structures like governments, international organizations, or legal frameworks. High reliance characterizes actions such as official Track I diplomacy, passing new legislation, or deploying UN peacekeepers [40]. These interventions require strong institutional legitimacy and capacity to succeed. Low reliance actions, such as informal community dialogues, grassroots civic initiatives, or individual acts of defiance against polarized norms, can thrive precisely in contexts where formal institutions are weak, corrupt, or non-existent [12]. Hybrid approaches that blend institutional backing with bottom-up engagement, such as using technology to complement traditional mediation methods, offer a pathway for addressing complex conflicts more effectively [48].

Use of Technology describes the integration of digital tools and platforms into the intervention. This spectrum ranges from traditional, low-tech methods like face-to-face meetings to a fully digital-first approach involving online dispute resolution platforms, algorithmic manipulation of social media feeds, or the use of generative AI for messaging

[26] [73] [80]. Technology is a double-edged sword in conflict zones. It can erode epistemic trust by creating filter bubbles and spreading disinformation, a phenomenon known as "epistemic churn" [69] [74]. Simultaneously, it can enable vital communication and coordination for humanitarian aid and peacebuilding activities, especially in areas with damaged physical infrastructure [17]. The effectiveness of technology is highly dependent on its sensitive contextualization within local norms and community trust networks [64].

Cultural Adaptability is the degree to which an action can be tailored to fit local norms, values, and power structures. Highly adaptable actions are often locally driven, such as indigenous reconciliation practices or community-led peace infrastructures built on pre-existing social networks [12]. In contrast, top-down interventions that impose external models—such as Western-style democratic reforms or standardized development programs—without considering local context often fail or can even exacerbate conflict [64]. Successful interventions, whether technological or otherwise, must be designed with a deep understanding of the local culture to be accepted and effective.

Reversibility and Risk Profile assesses the potential for an action to be undone and the associated risks. Some actions, like building a school or hospital in a conflict zone, are generally irreversible and carry lower direct risk, though they can become targets. Others, like a diplomatic agreement, are reversible and their collapse can heighten tensions. Economic sanctions present a high-risk profile, capable of causing severe humanitarian consequences if not carefully designed and monitored [85]. Corporate activism can also be risky, as discursive strategies can escalate conflict rather than resolve it [35].

Finally, a set of additional attributes provides crucial context for ethical and practical evaluation.

Attribute	Description	Example / Illustration
Resource Intensity	The amount of financial, human, and material resources required.	Deploying a large-scale peacekeeping contingent is high-intensity; a viral social media campaign is low-intensity. [92]
Legal Permissibility	The degree to which the action complies with domestic and international law.	Conducting diplomacy under International Humanitarian Law is permissible; assassinating political opponents is not. [103]
Ethical Implications	The moral considerations and potential for unintended harm or benefit.	Empowering women in peace processes has positive ethics; interventions that paradoxically fuel a desire for victory have negative implications. [23] [44]
Legitimacy Source	The basis of the actor's authority to act (e.g., popular mandate, legal charter, expertise).	A UN Security Council resolution derives legitimacy from international law; a community leader's authority comes from social consensus. [40]
Epistemic Trust Impact	How the action affects shared beliefs about truth and reality.	Disinformation campaigns erode trust; fact-checking initiatives can help repair it. [69]

These attributes form a comprehensive rubric for dissecting any de-escalation intervention, moving beyond simple categorization to a deeper analysis of its strategic value and potential pitfalls.

Real-World Applications: Documented Interventions Across the Action Spectrum

An examination of real-world interventions reveals how the proposed classification framework can be applied to analyze concrete actions aimed at cooling down interlocking crises. These examples span the full spectrum of actors, methods, and targets, demonstrating both the diversity of available tools and the inherent challenges of implementing them in complex environments.

At the **individual and organizational level**, civic engagement is a prominent theme. Community-based initiatives often serve as the bedrock of de-escalation efforts. For example, the work of insider mediators—individuals who intervene to de-escalate intercommunal tensions or bridge generational gaps—is crucial, as they are often the first responders in volatile situations [12]. Similarly, community planners frequently act as third actors, navigating the complexities of local politics to facilitate dialogue and manage contentious projects, such as those involving heritage district redevelopment that can otherwise spark conflict [30] [55]. These bottom-up approaches are highly culturally adaptable and rely on low institutional infrastructure, making them resilient in fragile contexts. On a larger scale, NGOs and P/CROs play a vital role in what is known as Track Two diplomacy. This involves unofficial conversations between former officials, academics, and civil society leaders from conflicting nations. While Turkish diplomats have historically expressed skepticism toward such foreign-led unofficial diplomacy, its proponents argue that P/CROs are instrumental in de-escalating violence and encouraging parties to pursue peaceful solutions [36] [38].

Moving to **state and international actors**, direct diplomatic and political actions are the primary tools for managing international armed conflict. The United Nations plays a central role through its Security Council, which issues resolutions calling for restraint and the silencing of guns, as seen in statements urging warring parties in Sudan to comply with UN proposals for a humanitarian pause [14] [40]. The Secretary-General himself engages in direct diplomacy, with contacts aimed at de-escalating tensions in regions like Lebanon [42]. Special envoys, such as the UN's Haysom in Haiti, are tasked with helping to

de-escalate political crises and encouraging parties to engage in good faith negotiations [41]. These interventions are high-institutional reliance and derive their legitimacy from international law, including IHL, which seeks to balance military necessity with humanitarian concerns [103]. Economic levers are another key tool used by states. China's development of its own sanctions legislation reflects a strategic response in an era of great power competition, demonstrating how economic pressure is used to achieve foreign policy objectives [85]. The World Bank Group also uses economic tools, advising authorities in fragile states on stabilizing domestic and international payment systems to support economic recovery [6].

The table below organizes several documented real-world examples using the multi-dimensional framework.

Intervention	Actor	Method	Target	Key Attributes
UN-Sponsored Humanitarian Pause in Sudan	International Body (UN)	Conflict Mitigation (Humanitarian Pause)	International & Domestic	Fast impact, High institutional reliance, Legally framed under IHL principles. [14]
US-Houthi Ceasefire in Yemen	State Actors (USA, Houthi)	Direct Diplomatic Action (Ceasefire Agreement)	International	Fast impact, High institutional reliance, Biproduct of Track I diplomacy. [13]
Track Two Diplomacy Between Turkey & USA	Organizations (P/CROs)	Direct Diplomatic Action (Unofficial Talks)	International	Slow impact, Low institutional reliance, Builds parallel channels for communication. [38]
World Bank Advice on Payment Systems	International Body (WBG)	Economic & Structural Lever (Advisory)	Domestic & International	Slow impact, High institutional reliance, Aims to stabilize economies. [6]
Community Dialogue Circles	Individuals & Organizations (Local NGOs)	Civic & Social Engagement (Dialogue)	Domestic	Variable speed, Low institutional reliance, Highly culturally adaptable. [12]
Promotion of Digital Citizen Participation	Individuals & Organizations (Govt/NGO)	Technological Mediation (Digital Platforms)	Domestic	Variable speed, Medium institutional reliance, Aims to improve policy concord. [26]
Special Envoy's Role in Haiti	State Institution (UN)	Direct Diplomatic Action (Mediation)	Domestic	Variable speed, High institutional reliance, Addresses political crisis and polarization. [41] [43]

These examples highlight the importance of context. A humanitarian pause can save lives immediately but may not address the root causes of conflict [14]. Track Two diplomacy can build trust over the long term but lacks the formal authority of Track One talks [38]. Digital platforms can empower citizens but also risk amplifying polarization if not carefully moderated [26]. The most effective strategies often involve a combination of these approaches, leveraging the strengths of each type of intervention while mitigating

their respective weaknesses. For instance, a Track Two dialogue might create the conditions for a successful Track One negotiation, which in turn can be legitimized and supported by a groundswell of public opinion shaped by civic engagement and digital advocacy.

Radical Alternatives: Plausible Innovations for Dual-Focus De-escalation

While existing interventions provide a valuable foundation, the complexity of interlocking crises demands innovative, radical, yet feasible alternatives. By synthesizing concepts from the provided sources, a series of novel approaches can be envisioned that move beyond conventional paradigms. These alternatives aim to break the vicious cycle of polarization and conflict by creating new incentives, re-framing problems, and leveraging emerging capabilities.

One promising avenue is the use of **Climate Adaptation as a Dual-Purpose De-escalation Lever**. Rather than treating climate change as a separate issue, this approach integrates it directly into conflict mitigation strategies. For example, instead of focusing solely on national-level conflict dynamics, projects could be designed to address community-based sources of conflict related to natural resource management, such as water scarcity along a contested border [65]. By creating joint transboundary commissions to manage shared water resources, communities on opposite sides of a conflict are forced to cooperate on a tangible, non-political issue that directly impacts their survival. This builds interdependence and creates a vested interest in maintaining peace. Such projects would simultaneously address a root cause of potential conflict (resource scarcity) and provide a practical platform for building trust and communication, thereby cooling both international tensions and domestic polarized attitudes towards the "other side."

Another radical yet plausible concept is **Algorithmic Trust Repair**. Current digital technologies, particularly social media algorithms, are largely optimized for engagement, which often means amplifying extreme content and reinforcing existing biases, thereby contributing to affective polarization [80]. An alternative design philosophy would be to develop "algorithmic trust repair" systems. These would be AI models trained not to maximize clicks, but to actively surface credible, cross-cutting information and connect users with moderate perspectives from the opposing group [80]. This would represent a fundamental shift from using algorithms to *cause* churn to using them to *re-establish* a

shared sense of reality [69]. Deployed on social media platforms or within news feed curation, such systems could counter the "epistemic churn" that leaves publics caught in unresolved cycles of meaning-making, potentially healing some of the foundational damage to social cohesion caused by affective polarization [74].

A third innovation is the creation of a **Corporate Peace Dividend Framework**. Recognizing the growing influence of corporations in conflict zones, this model reframes corporate activism from a potential source of conflict escalation into a direct driver of peacebuilding [35]. Under this framework, multinational corporations operating in fragile states would commit to linking executive compensation or corporate social responsibility budgets to measurable improvements in social cohesion metrics. These metrics could include reductions in hate speech, increases in cross-group collaboration, or improvements in perceptions of out-groups, measured through independent surveys. This aligns corporate financial interests with peacebuilding outcomes, creating a powerful incentive for businesses to invest in community reconciliation, support local entrepreneurs from all sides of a divide, and advocate for policies that reduce conflict, turning profit motives into a force for de-escalation.

Furthermore, the principle of **Threat-Agnostic Resilience Infrastructure** offers a paradigm shift in how physical and social infrastructure is designed in conflict-affected areas. Instead of building facilities to withstand a specific threat (e.g., bombs or floods), this approach advocates for modularity, diversity, and distributedness to create systems that are robust against a wide range of unforeseen hazards [66]. For example, hospitals, schools, and communication networks could be designed to remain functional during both war and climate-related disasters [17]. This focus on shared survival needs creates a common ground for cooperation among divided communities, who must pool resources to maintain these critical services. By reducing vulnerability and enhancing collective adaptive capacity, such infrastructure indirectly cools conflict by making cooperation more attractive than confrontation [66].

Finally, the punitive model of sanctions could be supplemented or replaced by **Reverse Sanctions**. While sanctions are a common tool of statecraft, their humanitarian impact can be severe and indiscriminate [85]. "Reverse sanctions" would involve offering rewards—such as lifting certain trade restrictions, providing humanitarian aid, or fast-tracking investment—to parties who demonstrate de-escalatory behavior. This could include releasing prisoners of war, allowing unfettered access for humanitarian convoys, or implementing a genuine ceasefire. This reframing from a purely negative reinforcement (punishment for bad behavior) to a positive one (reward for good behavior) could encourage incremental progress and build momentum towards a larger settlement. It

shifts the focus from punishing an adversary to incentivizing cooperation, which may be more effective in breaking deadlocks where neither side is willing to yield without a tangible gain. These radical alternatives, grounded in plausible extensions of current trends, offer new ways to tackle the intertwined crises of domestic polarization and international conflict.

Synthesis: Principles for Navigating Complex De-escalation Challenges

The analysis of de-escalation actions within contexts of interlocking domestic and international conflict reveals a complex, dynamic system that defies simplistic solutions. A static, single-axis classification is insufficient to capture the nuances of these challenges. Instead, a multi-dimensional framework, integrating actor, method, and target, combined with a comprehensive rubric of defining attributes, provides a robust analytical tool for understanding, evaluating, and designing effective interventions. The synthesis of the findings points to several overarching principles for navigating these intricate challenges.

First, any effective strategy must recognize and directly address the **vicious feedback loop** between domestic polarization and international conflict. Interventions that treat these as separate problems are destined to fail. The most promising actions are those that are dual-targeting, capable of producing ripple effects across both conflict domains. For instance, a successful Track II diplomatic initiative can build trust between elites, which can then be leveraged to calm polarized public discourse at home, while a well-managed humanitarian pause can create space for both local reconciliation efforts and renewed official negotiations [14] [38]. Breaking this cycle requires interventions that attack the problem from multiple angles simultaneously.

Second, there is a critical need to embrace **hybridity and bridging different scales of action**. The tension between top-down, institutionally-backed solutions and bottom-up, culturally-rooted civic actions is a recurring theme [63]. The most resilient and effective peacebuilding often occurs at the intersection of these two poles. High-level diplomatic agreements are hollow without buy-in from civil society and local communities, while grassroots initiatives lack the scale and legitimacy to solve large-scale problems without supportive institutional frameworks. Therefore, the most viable strategies are likely to be hybrid, blending formal and informal mechanisms. This could involve using technology to create a hybrid framework where digital tools complement traditional mediation

methods, or empowering local community planners as third actors who can bridge the gap between international actors and domestic realities [48] [55].

Third, the role of **technology and ethics** must be approached with deliberate intentionality. Technology is not inherently good or bad; its net effect is determined by its design and implementation. Algorithms that optimize for engagement can amplify division, while those designed for "trust repair" can foster connection [69] [80]. Similarly, the deployment of AI in warfare requires careful ethical consideration to avoid violating principles of distinction and proportionality [72]. Every intervention carries ethical implications. Empowering marginalized groups, such as women in peace processes, represents a positive ethical choice [44]. Conversely, corporate activism that escalates conflict or interventions that paradoxically fuel a desire for "victory" over peace are ethically problematic [23] [35]. A "just peace" framework, integrating theology, ethics, and technology, provides a necessary guide for ensuring that de-escalation efforts do not inadvertently cause further harm [71].

Finally, the evaluation of these actions requires moving beyond simplistic metrics of success. While speed and scalability are important, they must be weighed against factors like cultural adaptability, reversibility, and long-term sustainability. There is a documented need for more realistic evaluation frameworks for assessing the impact of peacebuilding activities, particularly in Fragile, Conflict-Affected (FCV) settings [52] [53]. A truly effective intervention is one that is not only implemented but also endured, one that builds transformative governance by bridging institutional accountability with equitable development, and fosters a liberatory praxis where communities have the 'room to grow' and the 'right to say no' to future conflict [51] [62].

In conclusion, the challenge of de-escalating interlocking crises demands a sophisticated, multi-layered approach. It requires a deep understanding of the destructive synergy between domestic and international conflict, a flexible framework for classifying and comparing diverse interventions, and a commitment to principled action that bridges different scales, embraces hybrid methods, and prioritizes long-term, sustainable peace over short-term fixes.
